

Research experience

While my experiences as a clinician have been diverse, research has been the most important and rewarding component of my postgraduate education. Committing myself to the world of scientific research has instilled an investigative mindset and a passion for the scientific process along with an appreciation for the results of medical research. Participating in research and the consequent interactions with my peers and seniors continues to provide me with skills that has paid dividends in my coursework and professional relationships. As a radiation oncologist, the core areas of my interest are aiming towards the improvement in disease related outcomes and toxicity profile of cancer patients through various interventions. I work in collaboration with other allied specialities to have a multidisciplinary approach .
