

1. Chakravarty C, Burman S.VA-ECMO in Landouzy Sepsis or Tubercular Septic Shock. J Anesth Crit Care Open Access 8(1): 00289.
  - This case defines a condition where the patient came with history of miliary tubercular sepsis and finally landed in acute respiratory distress syndrome. He was taken on extracorporeal membrane oxygenation and slowly developed central line associated blood stream infection which seeded in the brain. He was treated with Meropenem and Vancomycin and slowly recovered. The recovery was aslo and probably the CLABSI lead to a disseminated Koch's also called Landouzy sepsis.
2. Burman S, Das A, Gupta N. Atypical radiological presentation of bleomycin-induced lung injury: Case report and review of literature. Curr Med Res Pract 2020; 10:244-7.
  - An interesting case report of difficulty weaning after bleomycin treatment in a testicular cancer, later patient developed acute respiratory distress syndrome (ARDS) and succumbed to hypoxia. The patient had disseminated infection with evidence of meningitis and ventriculitis. He was treated with intrathecal antibiotics and responded accordingly.
