

### Citation

Ms. Preethi A's innovation on "Biodegradable, bioresorbable and bacteriostatic nanofibrous mesh for pelvic organ prolapse" is a significant and important development for which there is no other product or material available in market. The new product is resorbable and regenerative in nature thereby promoting the body to heal by itself. By using principles of biomedical engineering and material technology, she has made a perfect match for the properties of the mesh thereby providing surgeons and patients, a product suitable for surgical repair of pelvic organ prolapse and stress urinary incontinence.
